Please refer to the insert for the Limitations of Fire Alarm Systems

To keep your equipment in excellent working order, ongoing maintenance is required per the manufacturer’s recommendations and UL and NFPA standards. At a minimum, this detector must be tested and maintained regularly following NFPA 72 requirements. The detector should be cleaned at least once a year.

GENERAL DESCRIPTION

An HVAC system supplies conditioned air to virtually every area of a building. Smoke introduced into this air duct system is distributed to the entire building. Smoke detectors designed for use in air duct systems are used to sense the presence of smoke in the duct.

The D350P air duct smoke detector is a photoelectric detector. This smoke detection method combines with an efficient housing design that samples air passing through a duct and allows detection of a developing hazardous condition. When sufficient smoke is sensed, an alarm signal is initiated at the fire control panel monitoring the detector, and appropriate action can be taken to shut off fans, blowers and change over air handling systems, etc. This can prevent the distribution of toxic smoke and fire gases throughout the areas served by the duct system.

Two LEDs on each detector may illuminate, if programmed by the system control panel, to provide a local alarm indication. There is also a remote alarm output for use with auxiliary devices. The D350P has remote test capability with the RTS451/RTS451KEY Remote Test Station.

CONTENTS OF THE DUCT SMOKE DETECTOR HOUSING KIT

The D350P Duct Smoke Detector consists of the following items: (See Figure 1.)

1. Complete duct smoke detector assembly with sensor
2. Two #10 x 1\(\frac{1}{4}\)" sheet metal mounting screws
3. Two sampling tube filters
4. One test magnet
5. Drilling template
6. Two foam gaskets
7. Four #6 self-tapping mounting screws for the sampling tube and optional exhaust tube extension
8. One sampling tube end cap
9. One plastic sampling tube
10. One #6 self-tapping screw for plastic sampling tube

NOTE: A detector sensor board DOES NOT need to be ordered separately.

NOTE: For ducts over 1\(\frac{3}{4}\) ft, longer sampling tubes must be ordered to complete the installation. They must be the correct length for the width of the duct where they will be installed. See Table 1 on page 3 to determine the sampling tube required for different duct widths.

D350P INTELLIGENT PHOTOELECTRONIC DUCT SMOKE DETECTOR INSTALLATION AND MAINTENANCE INSTRUCTIONS

Before installing detectors, please thoroughly read the NEMA Guide for Proper Use of Smoke Detectors in Duct Applications, which provides detailed information on detector spacing, placement, zoning, wiring, and special applications. Copies of this manual are available from NEMA (National Electrical Manufacturers Association, 2101 L Street NW, Washington, DC 20037). NFPA Standards 72 and 90A should also be referenced for detailed information.

NOTICE: This manual shall be left with the owner/user of this equipment.

IMPORTANT: This detector must be tested and maintained regularly following NFPA 72 requirements. The detector should be cleaned at least once a year.

In summary, the D350P meets the requirements of Chapter 7 of NFPA 72, the National Fire Alarm Code, shall be followed. A preventative maintenance agreement should be arranged through the local fire authority.

Programming Specifications/Requirements for Intelligent System Control Panels

There are a limited number of devices that can have their LEDs programmed to illuminate. The actual number of devices is determined by the control panel and its ability to supply LED current. Refer to the Control Panel Installation Manual for details.

**Accessories**

- Remote LED
- Magnetic Remote Test
- Key-Activated Remote Test
- Replacement Filters
- Replacement Test Magnet
- Replacement Photoelectric Screen
- Replacement End Cap for Plastic Sampling Tube
- Replacement End Cap for Metal Sampling Tubes
- Replacement Photoelectric Sensor Board
- Replacement Power Board (w/o relay)

**Part No.**

- RA400Z
- RTS451
- RTS451KEY
- F36-09-11
- M02-04-00
- S08-39-01
- P48-61-00
- P48-21-00
- A5053FL
- A5067

**Dimensions**

- 350/1-3/4" L x 5/8" W x 21/4" D (37 cm L x 14 cm W x 7 cm D)

**Operating Voltage Range**

- 15 to 32 VDC

**Standby Current**

- 300 µA @ 24 VDC (one communication every 5 seconds with LED blink enabled)

**Operating Temperature**

- +32° to +131°F (0° to +55°C)

**Humidity Range**

- 10% to 93% (non-condensing)

**Storage Temperature**

- 32° to 131°F (0° to 55°C)

**Operating Current**

- 300 µA

**Replacement Power Board (w/o relay)**

- RA5067

**Replacement Photoelectric Sensor Board**

- A5053FL

**Replacement Filters**

- A56-0020-004R

**Replacement End Cap for Metal Sampling Tubes**

- P48-21-00

**Replacement End Cap for Plastic Sampling Tube**

- P48-61-00

**Replacement Test Magnet**

- M02-04-00

**Replacement Photoelectric Screen**

- S08-39-01

**Replacement Filters**

- A5053FL

**Replacement End Cap for Plastic Sampling Tube**

- P48-61-00

**Replacement End Cap for Metal Sampling Tubes**

- P48-21-00

**Replacement Photoelectric Sensor Board**

- A5053FL

**Replacement Power Board (w/o relay)**

- A5067

WARNING  
LIMITATIONS OF DUCT DETECTORS

The National Fire Protection Association has established that DUCT DETECTORS MUST NOT BE USED AS A SUBSTITUTE FOR OPEN AREA DETECTOR PROTECTION as a means of providing life safety. Nor are they a substitute for early warning in a building's regular fire detection system.

It is strongly recommended that the user read NFPA Standards 90A, 72, and 101.

This device will not operate without electrical power. Fire situations may cause an interruption of power. The system safeguards should be discussed with your local fire protection specialist.

This device will not sense smoke unless the ventilation system is operating.

In order to function properly, this detector must be installed according to the instructions. Do not exceed the electrical or ambient specifications or the detector will not function properly. This detector must be protected from the elements.

INSTALLATION SEQUENCE

Step 1. Verify duct air flow direction and velocity

Step 2. Drill the mounting holes

Step 2.1 Install the sampling tube for ducts less than 1 1/8 feet wide

Step 3. Secure the detector housing to the duct

Step 4. Install the sampling tube for ducts greater than 1 1/8 feet wide

Step 4.1 Installation for ducts greater than 1 1/8 feet but less than 8 feet wide

Step 4.2 Installation for ducts more than 8 feet wide

Step 5. Install the filters

Step 6. Field wiring

Step 7. Perform detector check

Step 8. Install the cover

Step 9. Detector Maintenance and Test Procedures

[1] Verify Duct Air Flow Direction And Velocity

The D350P duct smoke detector is designed to be used in air handling systems having air velocities of 500 to 4000 feet per minute. Be sure to check engineering specifications to ensure that the air velocity in the duct falls within these parameters. If necessary, use a velocity meter to check the air velocity in the duct.

Remove the paper backing from the mounting template supplied. Affix the template to the duct at the desired mounting location. Make sure the template lies flat and smooth on the duct. Center punch holes A and B. Drill the holes as indicated on the template.

[2.1] Sampling Tube Installation for Ducts Less Than 1 1/8 Feet Wide (see Figure 2)

1. Remove the front cover.
2. Slide the plastic sampling tube into the housing bushing and extend it the full width of the duct.
3. Align the holes in the bushing with the holes in the sampling tube. Secure with the #8 self-tapping screw into the bottom of the permanent tube. (Shown in figure 2.)

NOTE: The sampling tube end cap is critical to the proper operation of the duct smoke detectors. The end cap is needed to create the proper air flow to the sensor of the duct smoke detector.

NOTE: For ducts greater than 1 1/3 feet in width, refer to sections [4], [4.1] and [4.2].

[2.2.2] Alarm Tests

[2.2.2.1] M02-04-00 Magnet Test

1. Place the painted surface of the magnet onto the TEST locator on the bottom of the detector housing (Figure 11).
2. Verify system control panel alarm status and control panel execution of all intended auxiliary functions (i.e. fan shutdown, damper control, etc.)
3. The detector is self-restoring when the magnet is removed.

Verify that the system control panel has reset.

[2.2.2.2] RTS451/RTS451KEY Remote Station Test

The RTS451/RTS451KEY Remote Station Test facilitates test of the alarm capability of the duct smoke detector. These accessories provide the stimulus to initiate an alarm condition at the detector. The detector is self-restoring when the accessory test stimulus is removed. Verify that the system control panel has reset.

[2.3] Sensitivity Tests

Notify the proper authorities that the smoke detector system is undergoing maintenance, and that the system will temporarily be out of service. Disable the device or system undergoing maintenance to prevent unwanted alarms and possible dispatch of the fire department.

[9.3] Maintenance of Duct Smoke Detectors

[9.3.1] Air Filters

1. Turn off power to the system.
2. Remove and inspect sampling tube filters.
3. If filters are heavily coated with dirt, replace them with new filters (p/n F36-09-11). If they are not heavily coated, use a vacuum cleaner or compressed air nozzle to remove dust, then reinstall the filters.

[9.3.2] Photo Detector Boards

1. Remove the screen by gently grasping on each side and pulling straight off.
2. Lift the photo chamber in the same fashion. Vacuum the screen and cover. Use clean, compressed air to loosen and blow out any remaining debris. Replacement screens (p/n S08-39-01) are available.
3. Vacuum photo chamber, then use clean compressed air to blow area clean.
4. Replace the chamber by pressing it onto the base. Press the screen into place. It should fit tightly on the chamber.

[10] Board Replacement

[10.1] Sensor Board Replacement

1. Remove the two sensor board mounting screws.
2. Pull gently on the board to remove it.
3. To replace the board, align the board mounting features, holes, and the interconnect terminals. Push the board into place.
4. Secure board with the two mounting screws.

[10.2] Power Board Replacement

1. Disconnect wiring from the terminal block.
2. Remove the two power board mounting screws.
3. Pull gently on the board to remove it.
4. To replace the board, align the board mounting features, holes, and the interconnect terminals. Push the board into place.
5. Secure board with the two mounting screws.
6. Re-connect wiring to terminal block.

WARNING

This device will not operate without electrical power. Fire situations may cause an interruption of power. The system safeguards should be discussed with your local fire protection specialist.

This device will not sense smoke unless the ventilation system is operating.

In order to function properly, this detector must be installed according to the instructions. Do not exceed the electrical or ambient specifications or the detector will not function properly. This detector must be protected from the elements.
[9.1.1] Smoke Response
To determine if smoke is capable of entering the sensing chamber, visually identify any obstructions. Plug the exhaust and sampling tube holes to prevent ducted air from carrying smoke away from the detector head, then blow smoke such as cigarette, cotton wick, or punk directly at the head to cause an alarm. REMEMBER TO REMOVE THESE PLUGS AFTER THIS TEST, OR THE DETECTOR WILL NOT FUNCTION PROPERLY.

[9.1.2] Filter Replacement
The filters do not substantially affect smoke performance even when up to 90% of the filter is clogged. Quarterly visual inspection usually suffices to determine whether the filters should be replaced because only a high percentage of contamination affects performance. If further testing is required, compare differential pressure readings with and without the filters installed using a manometer. If the difference exceeds 10%, replace the filters. In no case should the pressure differential fall below 0.03 inches of water.

[9.2] Standby, Alarm, And Sensitivity Tests
[9.2.1] Standby And Trouble
Standby — If programmed by the system control panel, look for the presence of the flashing LEDs through the transparent housing cover. The LED will flash with each communication.
Trouble — If programmed by the system control panel and the detector LEDs do not flash, then the detector lacks power (check wiring, panel programming, or power supply), the detector board is missing (replace), or the unit is defective (return for repair).
Test — The trouble condition can be caused intentionally to verify correct operation of the system. Remove the detector board to cause a trouble condition locally and at the system control panel.

*Must extend a minimum of 1/4 the duct width.

Figure 4. Air duct detector sampling tube:

Figure 5. Tube mounting configurations with varying air flow direction:

NOTE: Only metal sampling tubes can be installed in orientations C and D.
4.2) Installation For Ducts More Than 8 Feet Wide

NOTE: To install sampling tubes in ducts more than 8 feet wide, work must be performed inside the air duct. Sampling in air ducts in widths of 8 feet or more is accomplished by using the ST-10 sampling tube. If the tube is shorter than the width of the air duct, install the end cap into the sampling tube as shown in Figure 4 and support the end opposite the duct smoke detector.

Installation of the sampling tube as follows:

1. Drill a 1-inch hole in the duct directly opposite the hole already drilled for the sampling tube. Make sure the hole is 1″ to 2″ below the inlet hole on the opposite side of the duct to allow for moisture drainage.
2. Slide the sampling tube with the flange into the housing bushing that meets the air flow first. Position the tube so that the arrow points into the air flow. Secure the tube flange to the housing bushing with two #6 self-tapping screws.
3. From inside the duct, couple the other sections of the sampling tube to the section already installed using the 1/4-inch conduit fittings supplied. Make sure that the holes on both of the sampling tubes are lined up and facing into the air flow.
4. Trim the end of the tube protruding through the duct so that 1 to 2″ of the tube extend outside the duct. Plug this end with the end cap and tape closed any holes in the protruding section of the tube. Be sure to seal the duct where the tube protrudes.

NOTE: An alternate method to using the ST-10 is to use two ST-5 sampling tubes. Remove the flange from one of the tubes and install as described above. After the installation, use electrical tape to close off some of the sampling holes so that there are a total of 10 to 12 holes spaced as evenly as possible across the width of the duct.

NOTE: Air currents inside the duct may cause excessive vibration, especially when the longer sampling tubes are used.

In these cases a 3-inch floor flange (available at most plumbing supply stores) may be used to fasten the sampling tube to the other side of the duct. When using the flange/connector mounting technique, drill a 1-inch to 1/2-inch hole where the flange will be used. Figure 6. Sampling tube filter installation:

[4] Install The Filters

To install the sampling tube filters, simply push the filters into the sampling and exhaust tube holes, as shown in Figure 6. If a metal sampling tube is used, install the filters over the tube end.

All wiring must be installed in compliance with the National Electrical Code and the local codes having jurisdiction. Proper wire gauges should be used. The conductors used to connect smoke detectors to control panels and accessory devices should be color-coded to prevent wiring mistakes. Improper connections can prevent a system from responding properly in the event of a fire.

Filters require periodic cleaning or replacement, depending on the amount of dust and dirt accumulated. Visually inspect the filters at least quarterly; inspect them more often if the dust accumulation warrants it. See Section [9.1.2] for more information. Replacement filters can be ordered (filter P/N F36-09-11).

For signal wiring, (the wiring between detectors or from detectors to auxiliary devices), it is usually recommended that single conductor wire be no smaller than 18 gauge. The duct smoke detector terminals accommodate wire sizes up to 12 gauge. The last foot of conduit should be flexible conduit (available in electrical supply houses), which facilitates easier installation and puts less strain on the conduit holes in the housing. Solid conduit connections may be used if desired.

CAUTION

Filters require periodic cleaning or replacement, depending on the amount of dust and dirt accumulated. Visually inspect the filters at least quarterly; inspect them more often if the dust accumulation warrants it. See Section [9.1.2] for more information. Replacement filters can be ordered (filter P/N F36-09-11).

For signal wiring, (the wiring between detectors or from detectors to auxiliary devices), it is usually recommended that single conductor wire be no smaller than 18 gauge. The duct smoke detector terminals accommodate wire sizes up to 12 gauge. The last foot of conduit should be flexible conduit (available in electrical supply houses), which facilitates easier installation and puts less strain on the conduit holes in the housing. Solid conduit connections may be used if desired.

Smoke detectors and alarm system control panels have specifications for Signaling-Line Circuit (SLC) wiring. Consult the control panel manufacturer’s specifications for wiring requirements for the particular model control panel being used before wiring the detector loop.

The D350P detector is designed for ease of wiring. The housing provides a terminal strip with clamping plates. Wiring connections are made by stripping about 1/8-inch of insulation from the end of the wire, sliding the bare end under the plate, and tightening the clamping plate screw.

Two LEDs on each duct smoke detector may light, if programmed by the system control panel, to provide a local, visible indication. Remote LED annunciator capability is available as an option. Each duct smoke detector can only be wired to one remote accessory.

FireLite panels offer different feature sets across different panel models. As a result, certain features of the D350P may be available on some control panels, but not on others. The possible features available in the D350P, if supported by the control panel are:

1. Panel controls the LED operation on the duct smoke detector. Operational modes are RED blink, RED continuous, GREEN blink, GREEN continuous, and off.
2. The remote output may be synchronized to the LED operation or controlled independent of the LEDs.

Please refer to the operation manual for the UL listed control panel for specific operation of the D350P wiring instructions.

Disconnect power from the communication line before installing the D350P duct smoke detectors.

Wire the D350P duct smoke detector per the Control Panel Installation Manual and Figures 6, 9 or 10. Set the desired address on the sensor board control wheel address switches.

NOTE: Some panels support extended addressing. In order to set the sensor above address number 99 on compatible systems, carefully remove the stop on the left hand rotary switch with pliers as shown in Figure 7.

[7] Perform Detector Check

1. Perform STANDBY AND TROUBLE TEST per Section [9.2.1].
2. Perform MAGNET TEST per Section [9.2.2.1]. The RTS451 test of Section [9.2.2.2] may substitute for this requirement.
3. Perform AIR FLOW TEST per Section [9.1].
4. Perform SMOKE RESPONSE TEST per Section [9.1.1].

[8] Install The Cover

Install the cover using the six screws that are captured in the housing cover. Be sure that the filters are installed as specified in Section [5]. Make sure that the cover fits into the base groove and that all gaskets are in their proper positions. Tighten the six screws.

[9] Duct Smoke Detector Maintenance and Test Procedures

Test and maintain duct smoke detectors as recommended in NFPA 72. The tests contained in this manual were devised to assist maintenance personnel in verification of proper detector operation.

Before conducting these tests, notify the proper authorities that the smoke detection system will be temporarily out of service. Disable the device or system under test to prevent unwanted alarms.

Smoke Entry Tests

[9.1] Air Flow

To verify sufficient sampling of ducted air, use a manometer to measure the differential pressure created from air flow across the sampling tubes. The pressure should measure no less than 0.03 inches of water and no greater than 1.4 inches of water. The air handler must be operating for this test.
